Artifact Rough Images and Story

Yixin Cao

Due to the greenhouse effect, the polar ice melted, and the sea covered everything on the earth. The world became an ocean world. Humans could only live on the abandoned ships. Soon, the ships could not provide enough living space, and the wandering humans had to figure an alternate way to live better. They try to adapt to the living environment of the ocean world. Humans developed artificial water lungs. When they were installed in the body, they could use the artificial water lungs for breathing, disintegrating oxygen from the surrounding water, which altered the respiratory system and made it possible for humans to survive underwater.

In addition, humans have developed a high-tech armor suit that mimics the features of a jellyfish to help them float around and light up underwater. The armor suit contains electricity that stuns strange creatures when they get close to it.
